Expectations of Your Full-Arch Fixed Prosthesis

Patient Name: _____

DOB: _____

- Not all patients are candidates for implants. Bone volume, density, health history, and medications will all be factors in determining your treatment plan.
- The objective of a full-arch fixed prosthesis is to improve chewing ability, esthetics, speech, and quality of life compared to traditional dentures.
- Because the prosthesis is thicker than natural teeth, some speech patterns may need time and practice to adjust.
- Your reasons for seeking dental implants and a fixed prosthesis should be realistic and guided by functional outcomes and anatomical limitations.
- Healing time is required for implants to be successful. Treatment timelines vary and may take up to 12–24 months depending on healing and phased treatment.
- During healing you may receive up to two prosthetic sets (healing and final). Additional prosthetics requested due to damage or cosmetic changes may incur additional fees (\$250–\$450).
- Implants have an approximate 94–96% success rate. Risks include infection, failure to integrate, smoking-related complications, or the need for additional surgery.
- Smoking, vaping, and nicotine use significantly increase implant failure risk. Stopping nicotine use at least two weeks prior to surgery and the week following is strongly recommended.
- Your final prosthesis typically includes 10–12 teeth per arch depending on anatomy and bone structure.
- If implants cannot be immediately loaded you may wear a traditional denture during the healing phase.
- Implants require lifelong maintenance and professional cleaning approximately every six months.
- Warranty coverage is contingent on compliance with home care instructions and maintenance visits.
- Final prosthetic failure will result in a warranty replacement.
- Should the temporary prosthesis fracture, you must notify the office and share a photo immediately.
